

Erik Kjems (DK): Data Quality and Availability is Essential for Smart Roads and Traffic Services!

More and more of our road and traffic data are used for real time information. We have a long tradition of collecting and working with data and our transport environment is packed with a great variety of systems. They have been designed and developed by different vendors, with different technologies for different purposes. We need these data. We need them with a good quality and easy accessibility. They can save lives or just make life a lot easier. We can make our transport systems a lot more effective or simply transport us in a smarter way using for instance public transportation or being on the road at the right time on the right spot. For that data availability and data quality is essential.

Presentation of a new short film, focusing on this question.
